# What Does and Online Research Data Repository Do?

The screenshot shows the homepage of the Texas Digital Library Test Dataverse. At the top, there is a blue star logo and the text "Texas Digital Library Test Dataverse" followed by "A statewide collaboration of higher education institutions in Texas". Below this, a "Metrics" bar shows "26 Downloads". A navigation bar contains a search bar, a "Find" button, an "Advanced Search" link, and an "Add Data" button. The main content area features a horizontal carousel of logos for participating institutions: Trinity University, UT Medical Branch (circled in red), University of Texas, Texas State University (circled in red), and others. A welcome message and an important note about the TwoRavens add-on are also present.

# One Size Does Not Fit All for Various Data Research Repository Project Needs

## Many Types of Data Projects (Sizes)

### 1) Normal range (<4GB Files <10GB Datasets)

Files/Data Fit on Server/Cloud, may be uploaded to the Data Repository, 4GB files, 10GB Datasets)

### 2) Large Projects, Bigger Data <TB

(Data may require specialized university IT Support, i.e. terabyte/petabyte tape drives, Pointers, Checksums)

### 3) Huge Projects, Big Data

(Projects require consortial possibilities, national models, **Texas Advanced Computer Center TAAC**, LyraSIS, Duracloud, AWS S3, Custom Solutions)

# Present Sizes of Texas Data Repository Datasets

Most 1MB <1GB, Greater than 10 GB+ Rare

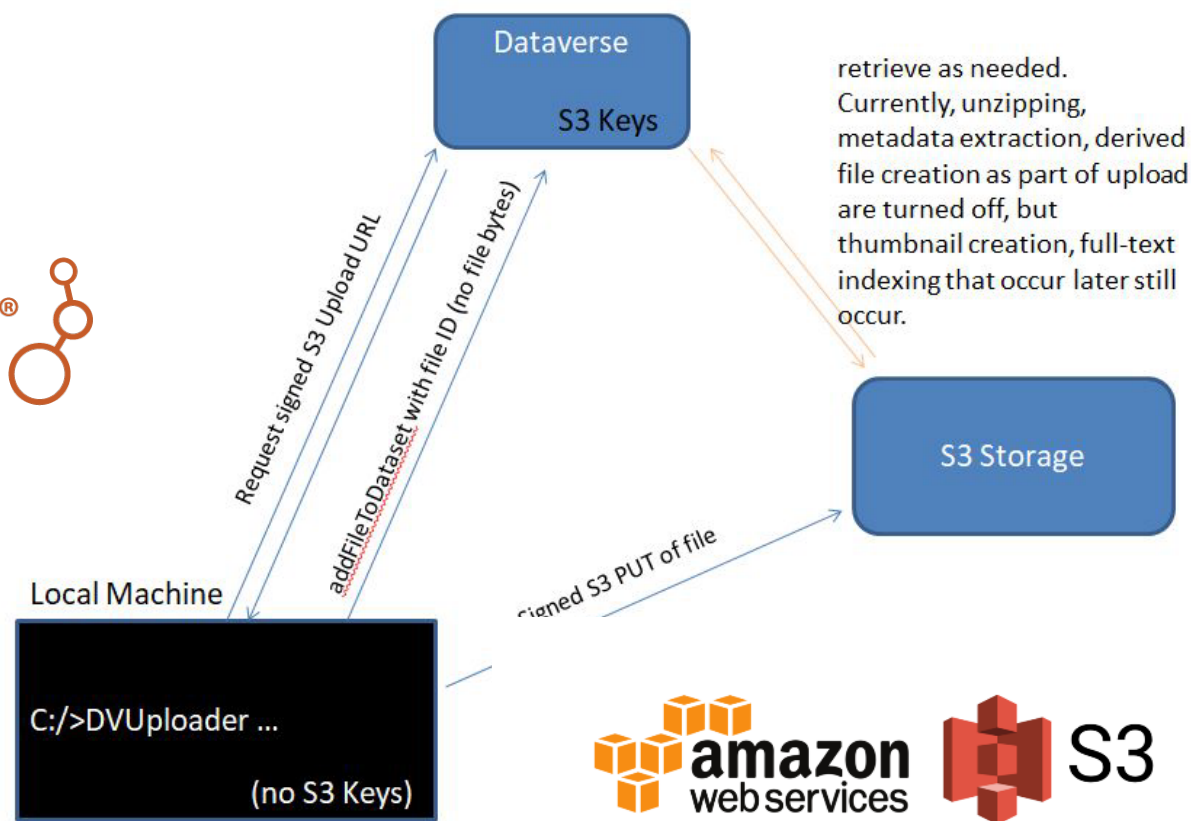

# Beta Prototyping Big & Bigger Data Options

2020-2022

Up to 300 GB/dataset  
Fee Based Institutional Model 7.5/13.5 K/Year

<20 GB Upload  
(Download Challenges)

### Description ⓘ

Training of neural networks for automated diagnosis of pigmented skin lesions is hampered by the small size and lack of diversity of available dataset of dermatoscopic images. We tackle this problem by releasing the HAM10000 ("Human Against Machine with 10000 training images") dataset. We collected dermatoscopic images from different populations, acquired and stored by different modalities. The final dataset consists of 10015 dermatoscopic images which can serve as a training set for academic machine learning purposes. Cases include a representative collection of all important diagnostic categories in the realm of pigmented lesions: Actinic keratoses and intraepithelial carcinoma / Bowen's disease ( **akiec** ), basal cell carcinoma ( **bcc** ), benign keratosis-like lesions (solar lentigines / seborrheic keratoses and lichen-planus like keratoses, **bk1** ), dermatofibroma ( **df** ), melanoma ( **mel** ), melanocytic nevi ( **nv** ) and vascular lesions (angiomas, angiokeratomas, pyogenic granulomas and hemorrhage, **vasc** ).

## Abstract

Each year, millions of people around the world are affected by cancer. Research shows that the early and accurate diagnosis of cancerous growths can have a major effect on improving mortality rates from cancer. As human diagnosis is prone to error, a deep-learning based computerized diagnostic system should be considered. In our research, we tackled the issues caused by difficulties in diagnosing skin cancer and distinguishing between different types of skin growths, especially without the use of advanced medical equipment and a high level of medical expertise of the diagnosticians. To do so, we have implemented a system that will use a deep-learning approach to be able to detect skin cancer from digital images. This paper discusses the identification of cancer from 7 different types of skin lesions from images using CNN with Keras Sequential API. We have used the publicly available HAM10000 dataset, obtained from the Harvard Dataverse. This dataset contains 10,015 labeled images of skin growths. We applied multiple data pre-processing methods after reading the data and before training our model. For accuracy checks and as a means of comparison we have pre-trained data, using ResNet50, DenseNet121, and VGG11, some well-known transfer learning models. This helps identify better methods of machine-learning application in the field of skin growth classification for skin cancer detection. Our model achieved an accuracy of over 97% in the proper identification of the type of skin growth.

## Keywords

Cancer detection; Convolutional neural networks; Image classification; Deep learning

## LC Subject Headings

Machine learning; Cognitive learning theory (Deep learning)

## Description

This thesis is submitted in partial fulfillment of the requirements for the degree of Bachelor of Science in Computer Science and Engineering, 2021.
